1. Overview

The dataset I have chosen is Flight Arrival Data from stat-computing.org (<http://stat-computing.org/dataexpo/2009/the-data.html>)

The dataset has various columns as described in the following sections. The main reason to select this dataset is the number of columns, data distribution by years and other small datasets which give information about carriers, airports and aircrafts. This will help me in performing MapReduce in efficient manner with the help of Java MapReduce, Hive and Pig.

In this project, the data I am using is of 10 years which is 1999-2008. Due to local disk space constraints, I avoided the previous 10 years' data. By going through the csv pattern, I observed that I can use 1999-2008 data for proper analysis. All csv files combined makes up 12.6 GB of disk space.

Project Code Repository URL: <https://github.com/kinnarrk/INFO7250BigData>

I have performed various analysis for flight delays, cancellations, airport congestions, airline efficiency – reliability, good and bad time to plan travel, better airline to choose for specific source – destination pair using recommendation model and various parameters affecting flight delays and cancellations.

I have used Hadoop MapReduce, Pig and Hive to do analysis and get the useful information out of the dataset. For visualization, I have used J2EE web application components and Google Charts JavaScript library for generating graphical representation.

2. Dataset Details

2.1. Variable Descriptions

| # | Name | Description |
|----|-------------------|---|
| 1 | Year | 1987-2008 |
| 2 | Month | 1-12 |
| 3 | DayofMonth | 1-31 |
| 4 | DayOfWeek | 1 (Monday) - 7 (Sunday) |
| 5 | DepTime | actual departure time (local, hhmm) |
| 6 | CRSDepTime | scheduled departure time (local, hhmm) |
| 7 | ArrTime | actual arrival time (local, hhmm) |
| 8 | CRSArrTime | scheduled arrival time (local, hhmm) |
| 9 | UniqueCarrier | <u>unique carrier code</u> |
| 10 | FlightNum | flight number |
| 11 | TailNum | plane tail number |
| 12 | ActualElapsedTime | in minutes |
| 13 | CRSElapsedTime | in minutes |
| 14 | AirTime | in minutes |
| 15 | ArrDelay | arrival delay, in minutes |
| 16 | DepDelay | departure delay, in minutes |
| 17 | Origin | origin <u>IATA airport code</u> |
| 18 | Dest | destination <u>IATA airport code</u> |
| 19 | Distance | in miles |
| 20 | TaxiIn | taxi in time, in minutes |
| 21 | TaxiOut | taxi out time in minutes |
| 22 | Cancelled | was the flight cancelled? |
| 23 | CancellationCode | reason for cancellation (A = carrier, B = weather, C = NAS, D = security) |
| 24 | Diverted | 1 = yes, 0 = no |
| 25 | CarrierDelay | in minutes |
| 26 | WeatherDelay | in minutes |
| 27 | NASDelay | in minutes |
| 28 | SecurityDelay | in minutes |
| 29 | LateAircraftDelay | in minutes |

3. Analysis of Flights using Hadoop MapReduce

3.1. Getting top 10 source destination airport pairs

This analysis gives us the basic understanding about busiest source and destination pairs. This gives us the idea about how flight booking trend is and if we want to avoid rush by choosing alternate source or destination airport. Job chaining has been carried out to get this information.

```
hadoop jar ~/Desktop/proj_jars/finalproject.jar  
com.kinnar.bigdataproject.top10_busy_airports.TopNApp  
/project/input/years /project/Top10SourceDestinations
```

```
kinnar@ubuntu:~$ hadoop fs -cat /project/Top10SourceDestinations/part-r-00000  
2019-12-13 09:31:17,308 INFO sasl.SaslDataTransferClient: SASL encryption trust check: localHostTrus  
ted = false, remoteHostTrusted = false

kinnar@ubuntu:~$
```

3.2. Unique Carriers Names with Flights Count

By doing this, we can get all the carriers with their names from different file which is carriers.csv. I have performed reducer side join to achieve this. This is divided in two parts: first get the flight count of each carrier and then perform join to get the carrier names.

```
hadoop jar ~/Desktop/proj_jars/finalproject.jar  
com.kinnar.bigdataproject.unique_carrier_names.CarriersApp  
/project/input/years /project
```

```
kinnar@ubuntu:~$ hadoop fs -cat /project/UniqueCarriersWithNames/part-r-00000

```

3.3. Year wise flight delay (> 15 minutes) and cancellation. Counts and Ratio

This will give us the idea about the historical data. It gives us information that which years were good and worse for the travelling. By combining weather conditions, we can do better analytics

```
hadoop jar ~/Desktop/proj_jars/finalproject.jar  
com.kinnar.bigdatapproject.yearly_delay.YearlyDelayApp  
/project/input/years /project/YearlyDelayCancel
```

The fields contained in the value part are: flightsCount, delayedFlightsCount, delayPercentage, canceledFlightsCount, canceledPercentage. The labels are removed for the sake of easy extraction while doing graphical representation.

```
kinnar@ubuntu:~$ hadoop fs -cat /project/YearlyDelayCancel/part-r-00000  
2019-12-13 05:24:00,353 INFO sasl.SaslDataTransferClient: SASL encryption trust check: localHostTrus

2008 7009728,1466191,20.92,137434,1.96
```

3.4. Flight delay and cancellation by carrier including carrier names

This is important to analyse which carrier creates more delay and gives us important information about choosing the flights which are on time. For this analysis, showing carrier name is important so I have carried out reducer side join. Also, job chaining is needed for the analysis so after chaining, join has been carried out to show carrier information.

```
hadoop jar ~/Desktop/proj_jars/finalproject.jar  
com.kinnar.bigdatapproject.carrier_delay_cancel.CarrierDelayCancelApp  
/project/input/years /project/input/carriers.csv

```

3.5. Date wise flight delay (> 15 minutes) and cancellation. Counts and Ratio

This MapReduce is one of the most important part of the analysis. For graphical representation, this was the key to see so many patterns in the flight delay and cancellation. This gives us clear picture about the historical data and how we can take a good decision about when to travel and what time should be avoided. Although, this MapReduce is not so difficult to carry out, but the data it can represent is very important. Graphical representation will be explained in the later part of the report.

```
hadoop jar ~/Desktop/proj_jars/finalproject.jar
com.kinnar.bigdataproyect.daily_delay_cancel.DailyDelayCancelApp
/project/input/years /project/DailyDelayCancel
```

Same as year wise details, the fields contained in the value part are: flightsCount, delayedFlightsCount, delayPercentage, canceledFlightsCount, canceledPercentage. The labels are removed for the sake of easy extraction while doing graphical representation.

3.6. Average distance covered and airtime done by each carrier

This analysis is useful for viewing carrier reach and capacity. We can segregate the carriers by their ranks using this analysis. This information combined with delay and cancellation details gives us the overall reliability and quality of the airline service.

```

hadoop jar ~/Desktop/proj_jars/finalproject.jar
com.kinnar.bigdataproyect.avg_dist_carrier.AverageMain
/project/input/years /project/AvgDistAirtime

```

CONGESTION IN THE SKY

3.7. Recommendation System using RMS (Root Mean Square)

This process is divided in two parts: First we need to calculate average of arrival and departure delay for each source destination pair for each carrier. After that, second part is to calculate RMS value for average of arrival and departure delay.

Once this is done, we have to sort the result in ascending order by the RMS value. This will give us the recommendation for choosing carrier for source and destination pair.

```

hadoop jar ~/Desktop/proj_jars/finalproject.jar

Get the recommended carrier for source-destination pair

4. Analysis of flights using Pig on Hadoop

4.1. Top 10 cities by total traffic of flights

Here, this analysis would be very difficult to achieve by Java MapReduce. Pig makes it really easy and less time consuming. It also executes really fast and it can leverage the facility to run on the local mode using `-x local switch`.

This analysis gives us the information about the busies cities by traffic. For each airport, we are finding number of inbound, outbound and all flights.

CONGESTION IN THE SKY

```

Documents 1top10airportsbytraffic.pig Save
~/Documents/project/INFO7200BigData/pig_scripts

1top10airportsby... x
-- Top 10 airports by traffic - only year 2008 data

                1,MDW,3284

```

4.2. Popular carriers

Let's calculate the volume of each carrier by total flights of a year. Carrier ranking is carried out by their median volume value over 10 years' span.

```

Documents  Open  [icon]  2popularcarriers.pig
~/Documents/project/INFO7200BigData/pig_scripts  Save  [icon]  [icon]  [icon]

2popularcarriers.... x -- Carrier popularity
-- First, we load the raw data from the dataset - year 2008
RAW_DATA = LOAD '/home/kinnar/Desktop/proj_dataset/2008.csv' USING
PigStorage(',') AS
(year: int, month: int, day: int, dow: int,
 dtime: int, sdttime: int, arftime: int, satime: int,
 carrier: chararray, fn: int, tn: chararray,
 etime: int, setime: int, airtime: int,
 adelay: int, ddelay: int,
 scode: chararray, dcode: chararray, dist: int,
 tintime: int, touttime: int,
 cancel: chararray, cancelcode: chararray, diverted: int,
 cdelay: int, wdelay: int, ndelay: int, sdelay: int, latedelay: int);

CARRIER_DATA = FOREACH RAW_DATA GENERATE month AS m, carrier AS cname;
GROUP_CARRIERS = GROUP CARRIER_DATA BY (m,cname);
COUNT_CARRIERS = FOREACH GROUP_CARRIERS GENERATE FLATTEN(group),
(COUNT(CARRIER_DATA)) AS popularity;

STORE COUNT_CARRIERS INTO '/home/kinnar/Documents/project/INFO7200BigData/
pig_output/2top_carriers' USING PigStorage(',');
--dump top_carriers

```

Output: The data output is very less because I took 2008 year's data. It would give better result if I use 10 years data.

```

Documents  Open  [icon]  part-r-00000
~/Documents/project/INFO7200BigData/pig_output/2top_carriers  Save  [icon]  [icon]  [icon]

part-r-00000 x 1,NK,2
                1,NW,2
                1,WN,49995

```

4.3. Most busy routes (descending order)

In this part of analysis, the idea is to create a frequency table for unordered pair (m, n) in which they are the unique pairs of airport codes and it will give us one of the most important information that which airport pairs are busiest.

```
-- Most busy routes
-- First, we load the raw data from the dataset - year 2008
RAW_DATA = LOAD '/home/kinnar/Desktop/proj_dataset/2008.csv' USING
PigStorage(',') AS
(year: int, month: int, day: int, dow: int,
 dtime: int, sdttime: int, artime: int, satime: int,
 carrier: chararray, fn: int, tn: chararray,
 etime: int, setime: int, airtime: int,
 adelay: int, ddelay: int,
 scode: chararray, dcode: chararray, dist: int,
 tintime: int, touttime: int,
 cancel: chararray, cancelcode: chararray, diverted: int,
 cdelay: int, wdelay: int, ndelay: int, sdelay: int, latedelay: int);

-----

-- APPROACH 1:
-- The idea is to build a frequency table for the unordered pair (i,j) where i
and j are distinct airport codes
-- This means we are not interested in any relative counts. In APPROACH 2 we
will see how to do this

-- QUESTION: what about the shuffle key space? Is it balanced? How can it be
made balanced?
-----

-- project to get rid of unused fields
A = FOREACH RAW_DATA GENERATE scode AS s, dcode AS d;

-- group by (s,d) pair
B = GROUP A BY (s,d);

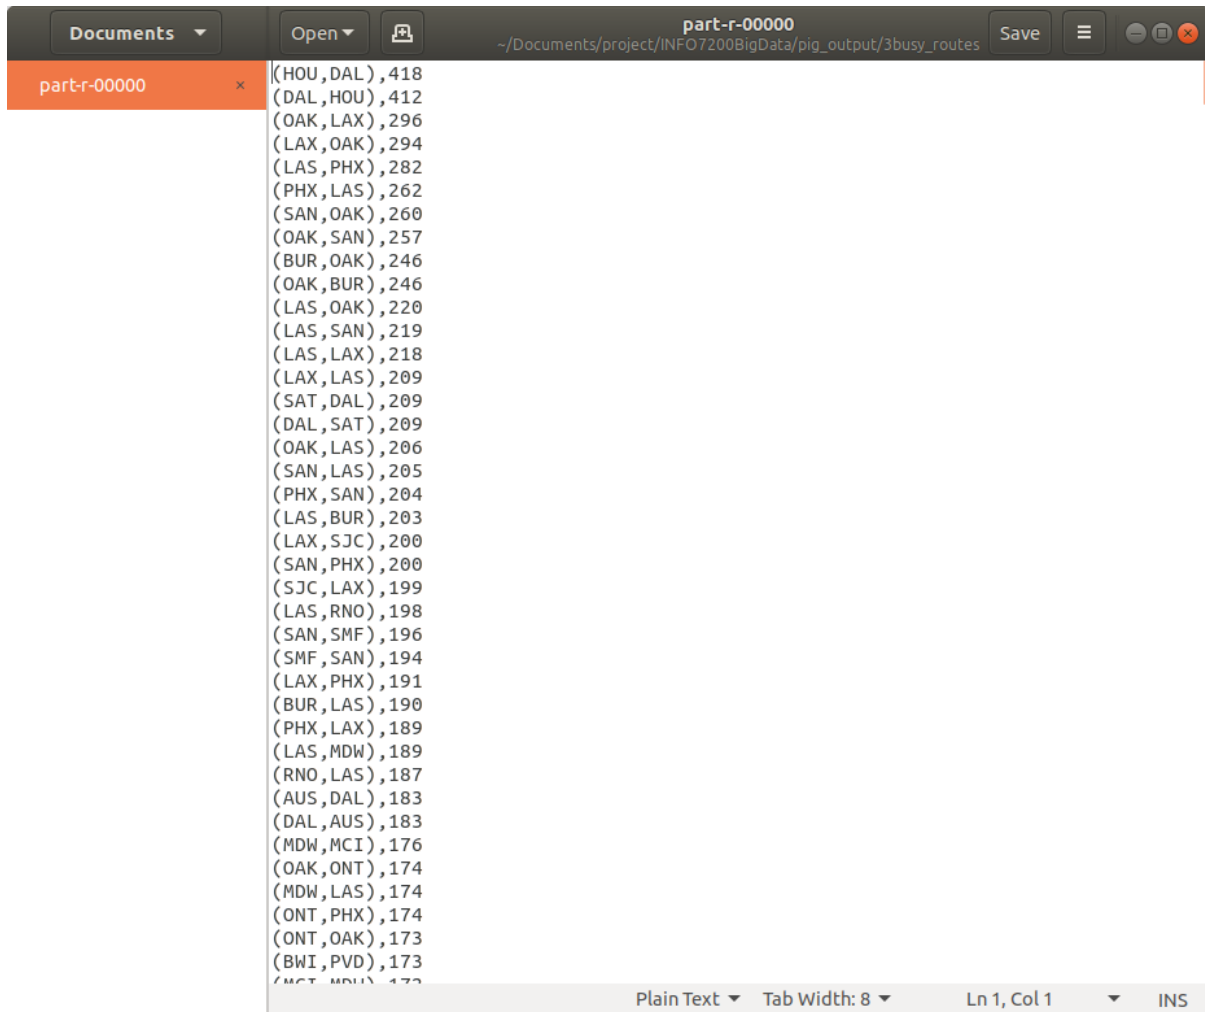

COUNT = FOREACH B GENERATE group, COUNT(A) AS CNT;

INVORDER = ORDER COUNT BY CNT DESC;

--dump COUNT;
STORE INVORDER INTO '/home/kinnar/Documents/project/INF072008BigData/pig_output/
3busy_routes' USING PigStorage(',');
```

Output: We are sorting them in descending order so we can check the busiest and popular pair of airports which in turn are source and destinations

CONGESTION IN THE SKY

5. Analysis on Flights using Hive on Hadoop

Hive makes it easy to do analysis since it supports SQL which is one of the most familiar languages for data extraction and manipulation.

Following are the commands used for executing some tasks on Hive. They are according to the below steps:

5.1. Create FlightSchema and setup the parameters

```
create schema FlightSchema;  
  
use FlightSchema;  
  
SET hive.exec.dynamic.partition = true;  
  
SET hive.exec.dynamic.partition.mode = nonstrict;
```

5.2. Create table flights and load data from hdfs path

```
create external table flights(Year INT, Month INT, DayofMonth INT,  
DayOfWeek INT, DepTime INT, CRSDepTime INT, ArrTime INT, CRSArrTime
```

CONGESTION IN THE SKY

```
INT, UniqueCarrier String, FlightNum INT, TailNum String,  
ActualElapsedTime INT, CRSElapsedTime INT, AirTime INT, ArrDelay  
INT, DepDelay INT, Origin String, Dest String, Distance INT, TaxiIn  
INT, TaxiOut INT, Cancelled INT, CancellationCode String, Diverted  
String, CarrierDelay INT, WeatherDelay INT, NASDelay INT,  
SecurityDelay INT, LateAircraftDelay INT ) ROW FORMAT DELIMITED  
FIELDS TERMINATED BY ',';
```

```
LOAD DATA INPATH '/project/input/flights.csv' OVERWRITE INTO TABLE  
flights;
```

5.3. Create table airports and load data from hdfs path

```
create external table airports (Iata String, airport String, city  
String, state String, country String, lat String, longi String) ROW  
FORMAT DELIMITED FIELDS TERMINATED BY ',';
```

```
LOAD DATA INPATH '/project/input/airports.csv' OVERWRITE INTO TABLE  
airports;
```

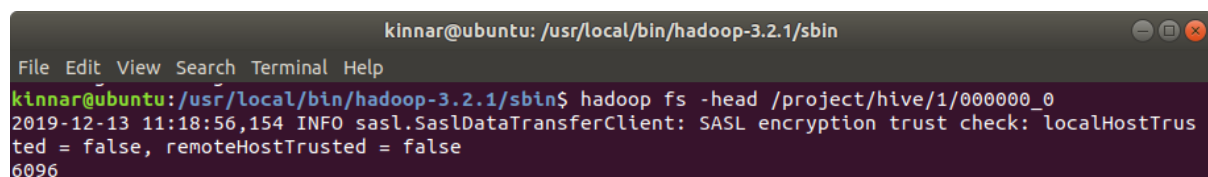

5.4. Create table carriers and load data from hdfs path

```
create external table carriers (Code String, Description String) ROW  
FORMAT DELIMITED FIELDS TERMINATED BY ',';
```

```
LOAD DATA INPATH '/project/input/carriers.csv' OVERWRITE INTO TABLE  
carriers;
```

5.5. Find flights which travelled more than 500 airmiles

```
INSERT OVERWRITE DIRECTORY '/project/hive/1' select count(*) from  
flights where AirTime > 500;
```

The screenshot shows a terminal window titled 'kinnar@ubuntu: /usr/local/bin/hadoop-3.2.1/sbin'. The command executed is 'hadoop fs -head /project/hive/1/000000_0'. The output shows a log entry from 'sasL.SaslDataTransferClient' indicating a SASL encryption trust check where 'localHostTrusted = false' and 'remoteHostTrusted = false'. The command returns exit code 6096.

5.6. Find flights which arrive and depart on time

```
INSERT OVERWRITE DIRECTORY '/project/hive/2' select  
Year,Month,DayofMonth,Origin,Dest,AirTime,Distance,TaxiIn,TaxiOut  
from flights where DepTime<=CRSDepTime and ArrTime<=CRSArrTime;
```

CONGESTION IN THE SKY

6. Graphical Representation and Analysis

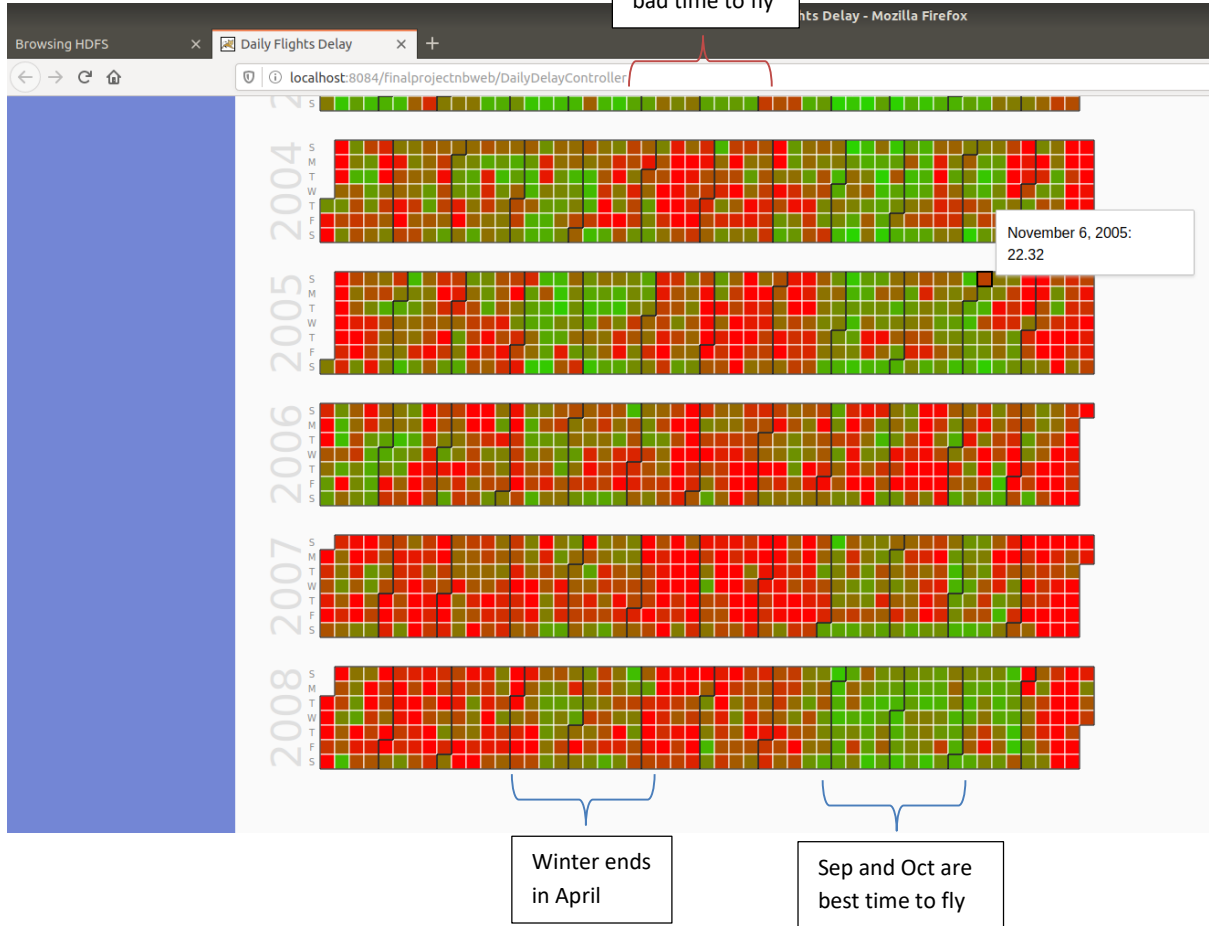

We can do many meaningful analyses from the graphical representation rather than the textual data. I will show you how impactful the graphical representation can be. This web application source code can be found from the github repo url mentioned in the overview section.

6.1. % of flight departures delayed > 15 minutes – daily basis

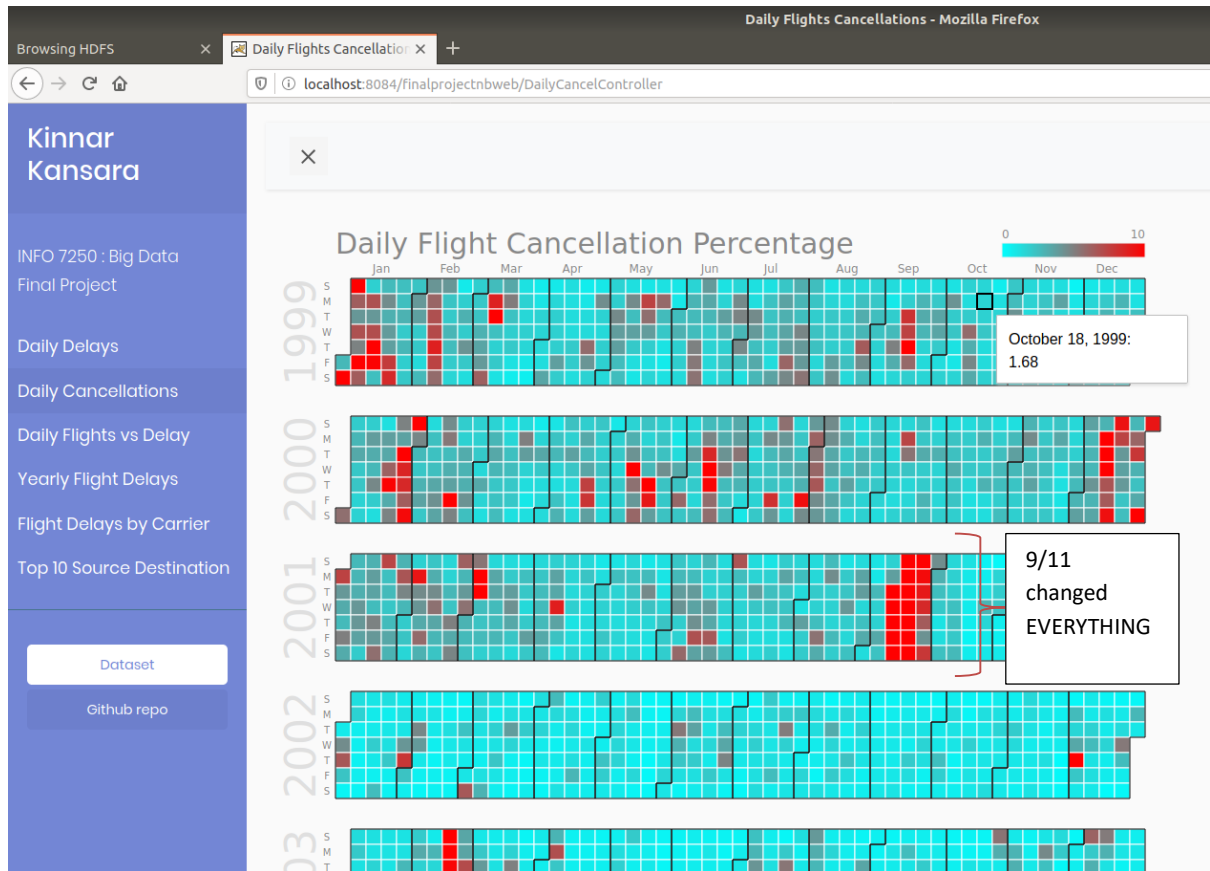

CONGESTION

Summers are
bad time to fly

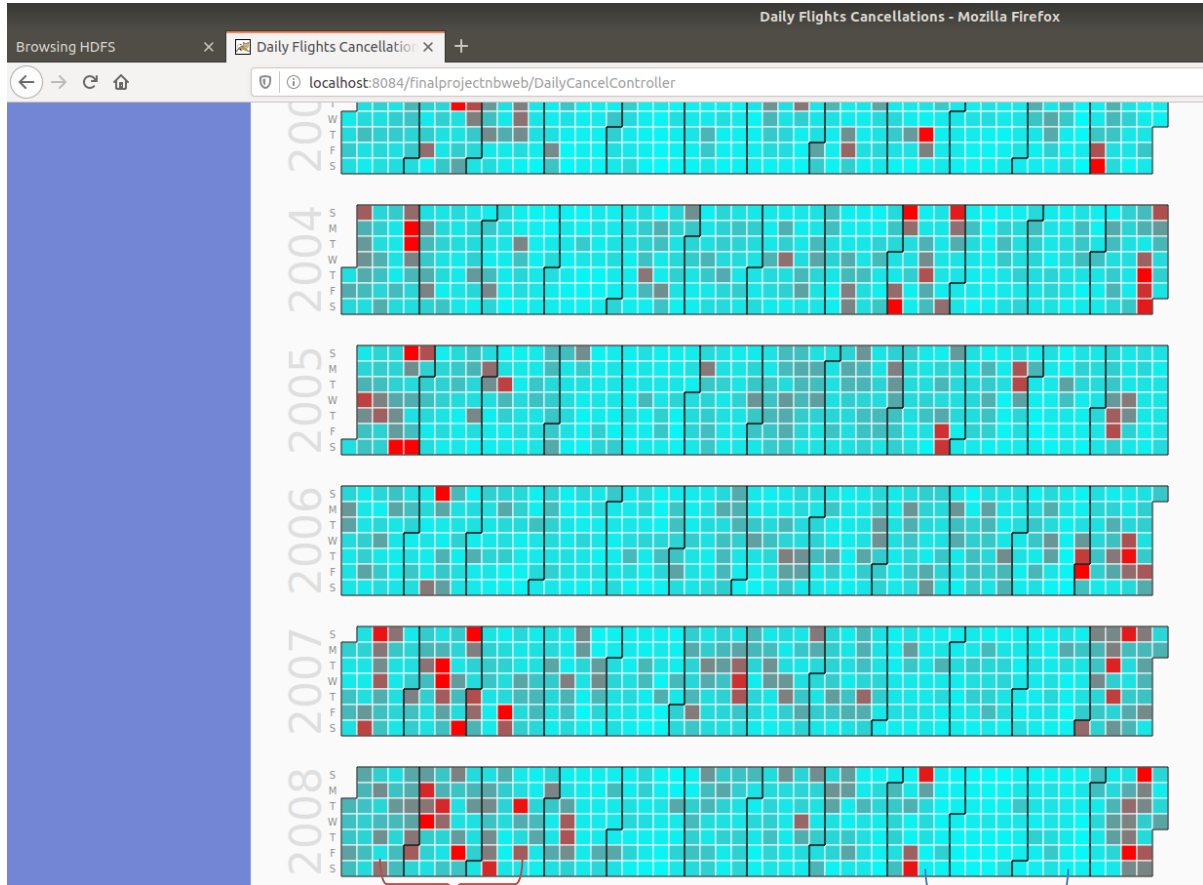

CONGESTION IN THE SKY

6.2. % of flight cancelled – daily basis

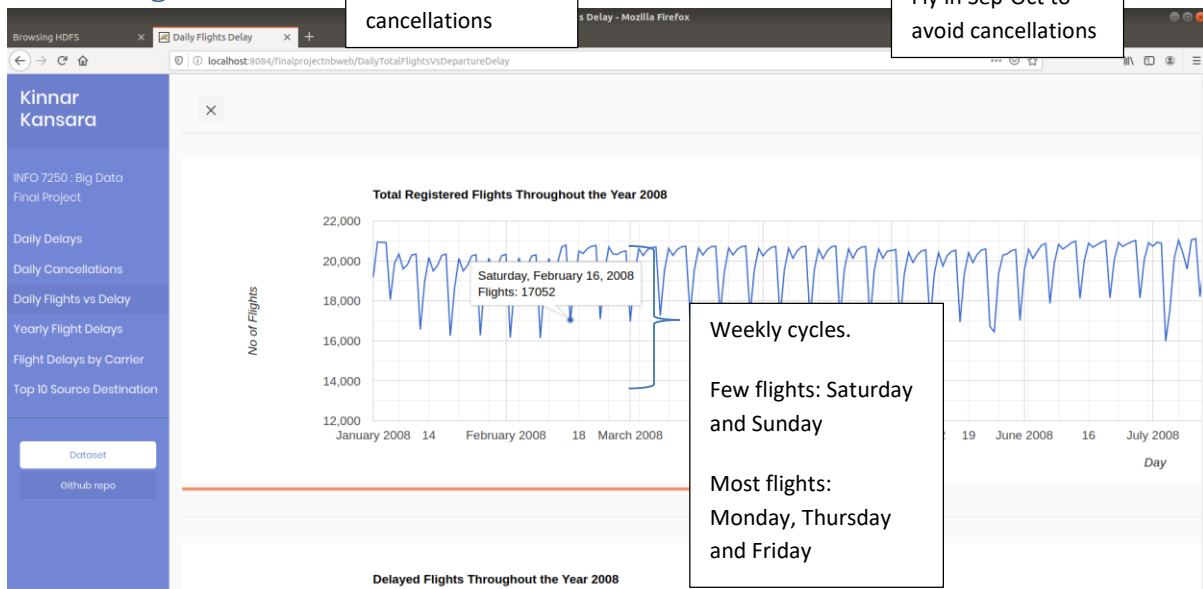

CONGESTION IN THE SKY

6.3. Flight trend on

Winter leads to
cancellations

Fly in Sep-Oct to
avoid cancellations

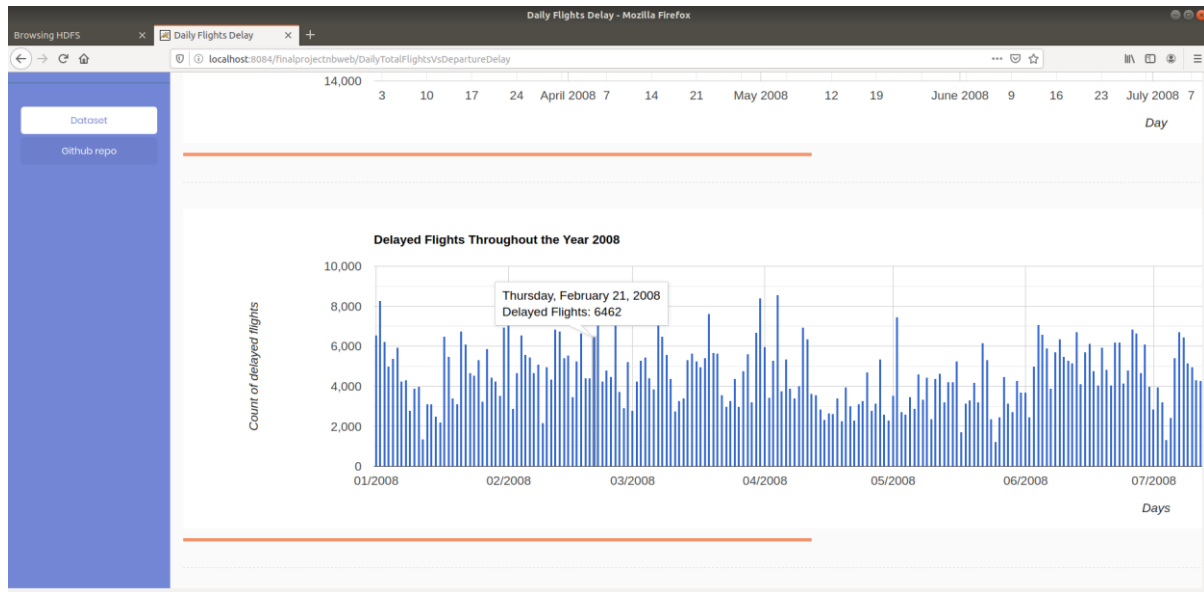

CONGESTION IN THE SKY

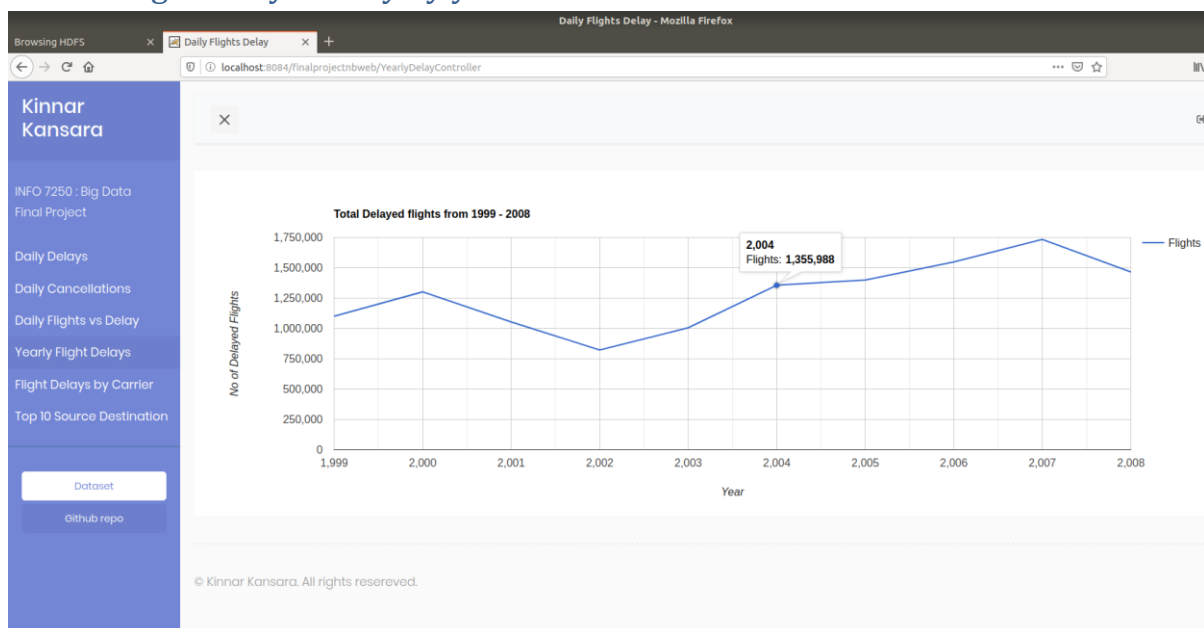

CONGESTION IN THE SKY

6.4. Delayed flights trend on daily basis

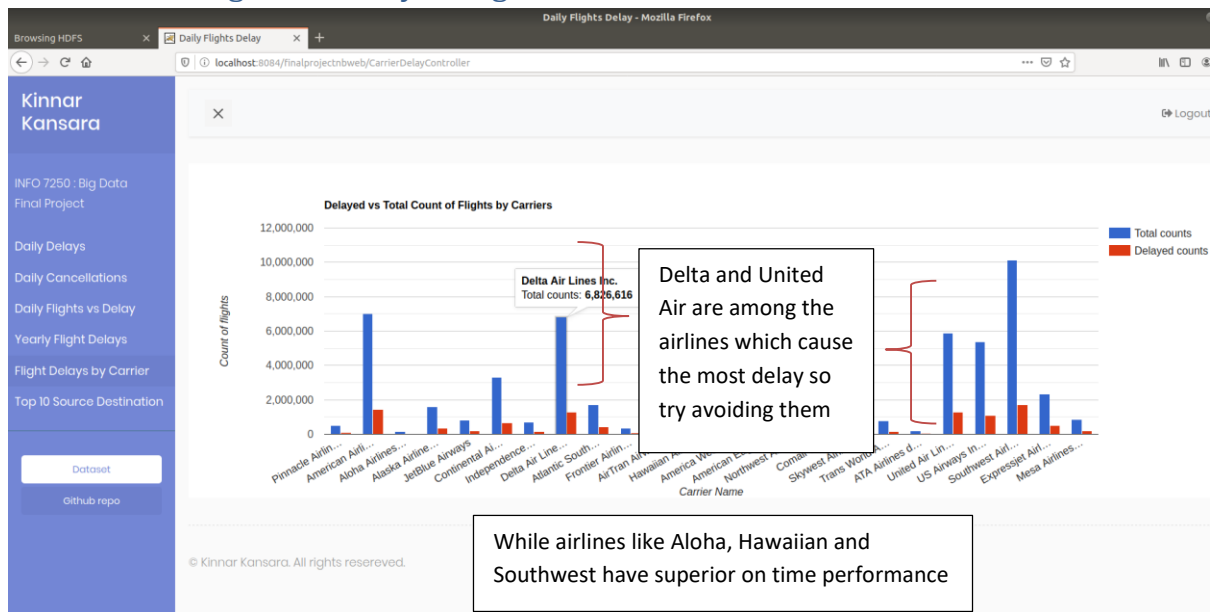

6.5. Flight delay history by year

CONGESTION IN THE SKY

6.6. Total flights vs delayed flights for each carrier

6.7. Tabular view of top 10 most popular source destination pairs

| Top 10 Source Destination Pair Counts | | | |
|---------------------------------------|--------|-------------|--------|
| # | Source | Destination | Count |
| 1 | LAX | LAS | 137997 |
| 2 | LAS | LAX | 135016 |
| 3 | PHX | LAX | 123517 |
| 4 | LAX | PHX | 121631 |
| 5 | SFO | LAX | 117850 |
| 6 | LAX | SFO | 116318 |
| 7 | LAS | PHX | 116273 |
| 8 | ORD | MSP | 114370 |
| 9 | PHX | LAS | 114233 |
| 10 | MSP | ORD | 113753 |

7. Lessons Learned & tips for travellers

- Avoid flying during holidays and summer to avoid delays and cancellations due to huge rush
- Fly in April, May, September and October
- Watch the weather!
- Avoid busy airports like JFK, Newark, Chicago which are causing consistent delays
- Use carriers like Southwest, Aloha and Hawaiian with better on-time performance
- Avoid flights which depart at peak hours like 5 to 7 pm.
- Some factors like 9/11 cause tremendous impact on the aviation industry

8. Challenges

- I could incorporate the weather details with the analysis but due to inconsistent weather and flight data could not lead to a valuable analysis

9. Future Scope

- More analysis with graphical representations can lead to better timing performances
- I could do better analysis with aircrafts like how old are they, what models generally create delays, etc.
